DETAILED ACTION

Claim Rejections - 35 USC § 103

The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

(a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negated by the manner in which the invention was made.

Claims 35-50 are rejected under 35 U.S.C. 103(a) as being unpatentable over Shin et al (2003/0132466) in view of Matshuhashi (JP 05226361) and Stolk (WO 00/77828) cited on the IDS filed on 1-12-06. The Shin and Matshuhashi references teach the basic inventive concept of forming a gate electrode with different work function portions across the gate electrode, whereby, for NFET devices the outer portions of the gate electrode will have a lower work function than the central gate portion, with the opposite relationship used for PFET devices.

The reference to Stolk appears to show the newly added claimed feature wherein the combination gate is formed in a trench, and where the gate dielectric extends along the bottom of the trench as well as up the sidewalls of the trench. See, for example the device shown in FIG. 10 of Stolk. Stolk also uses gate electrode portions with different work functions, and his disclosure of a gate dielectric lining the trench would be applicable to and particular work function arrangement.

Taken together, these references appear to teach all of the claimed features, and one skilled in the art would be motivated to combine these references in order to achieve superior device characteristics.
